

U19CS009 → Brijesh Rameshbhai Rohit

Q-1

What will be the hamming distance for all the different combination and minimum hamming distance for give code words

→

| Data words | Code words |
|------------|------------|
| 00 | 00000 |
| 01 | 01011 |
| 10 | 10111 |
| 11 | 11111 |

$$d(00000, 01011) = 3$$

$$d(01011, 10111) = 3$$

$$d(00000, 10111) = 4$$

$$d(10110, 11111) = 1$$

$$d(00000, 11111) = 5$$

$$d(01011, 11111) = 2$$

$$d_{\min} = 1$$

Q-2

Find the minimum Hamming distance for

a.) Detection of two errors

b.) Correction of two errors.

→ d_{\min} for

a.) Detection of two errors:-

$$\begin{aligned} d_{\min} &= S + 1 \\ &= 2 + 1 \\ &= 3 \end{aligned}$$

b.) Correction of two errors:-

$$\begin{aligned} d_{\min} &= 2t + 1 \\ &= 4 + 1 \\ &= 5 \end{aligned}$$

Q-3 Check whether the given codewords are linear code or not. Give justification of your answer.

| → | Datamord | Codeword |
|---|----------|-----------|
| | 0 0 | 0 0 0 0 0 |
| | 0 1 | 0 1 0 1 1 |
| | 1 0 | 1 0 1 1 1 |
| | 1 1 | 1 1 1 1 1 |

→ Linear codeword is a code in which XOR of two valid codewords creates another valid codeword.

$$01011 \oplus 10111 = 11100 \neq 11111$$

∴ given codeword are not linear.

Q-4 In CRC, given the datawords 101001110 and the divisor 1011.

a) Show the generation of codeword at Sender side

b) Show checking of codewords at the receiver site.

→ given

$$\text{dataword} = 101001110$$

$$\text{divisor} = 1011$$

a)

codeword at sender side

10100111101010

b) checking at receiver side

$$\begin{array}{r}
 1001101110 \\
 10111 \mid 10100111101010 \\
 \hline
 101111 \downarrow \\
 000111 \\
 000000 \downarrow \\
 0001111 \\
 0000000 \downarrow \\
 00011111 \\
 00010111 \downarrow \\
 000010001 \\
 000010111 \downarrow \\
 0000001100 \\
 0000000000 \downarrow \\
 00000011001 \\
 00000010111 \downarrow \\
 000000011100 \\
 000000010111 \downarrow \\
 0000000010111 \\
 00000000010111 \downarrow \\
 00000000000000 \\
 00000000000000 \\
 00000000000000
 \end{array}$$

→ Dataword is accepted.

d-5 In Hamming code $C(7,4)$.

a) If dataword at sender location is 0101, what will be the code word?

→

$$\text{codeword} = 0101r_2r_1r_0$$

$$r_0 = (a_3 + a_1 + a_0) \% 2 = (1 + 0 + 1) \% 2 = 0$$

$$r_1 = (a_3 + a_2 + a_1) \% 2 = (0 + 1 + 0) \% 2 = 1$$

$$r_2 = (a_3 + a_1 + a_0) \% 2 = (0 + 0 + 1) \% 2 = 1$$

$$\therefore \text{codeword} = \underline{0101110}$$

b) If receiver receives 0001110, what will be the syndrome value (s_2, s_1, s_0) and which bit is corrupted during transmission? what will be the derived dataword from received codeword?

$$\overline{0001110}$$

$$s_0 = (b_3 + b_1 + b_0 + r_0) \% 2 = (0 + 0 + 0 + 0) \% 2 = 0$$

$$s_1 = (b_3 + b_2 + b_1 + r_1) \% 2 = (0 + 0 + 0 + 1) \% 2 = 1$$

$$s_2 = (b_3 + b_1 + b_0 + r_2) \% 2 = (0 + 0 + 1 + 1) \% 2 = 0$$

$$\therefore \text{syndrome value } (s_2, s_1, s_0) = (0, 1, 0)$$

$\Rightarrow \therefore b_2$ needs to be flipped

$$s_0 \quad 0001 \rightarrow \boxed{0101}$$

derived dataword.
